

API Integration & JSON Handling

Submitted By:
Manasa Sangadala

Objective:
To understand JSON handling and data storage using Python programming.

Tools Used:

- Python
- Replit
- JSON Module

Project Description:
This project demonstrates JSON handling operations using Python. The program creates user data, converts the data into JSON format, displays the JSON output, and stores the data into a JSON file.

The project also uses exception handling to manage errors efficiently.

Python Code:

```
import json

try:
    data = {
        "name": "Manasa",
        "email": "manasa.sangadala@gmail.com",
        "city": "Pileru"
    }

    json_data = json.dumps(data, indent=4)

    print("User Details:\n")
    print(json_data)

    with open("user_data.json", "w") as file:
        file.write(json_data)
```

```
print("\nJSON data saved successfully!")
```

```
except Exception as e:  
    print("Error:", e)
```

Output:

User Details:

```
{  
  "name": "Manasa",  
  "email": "manasa.sangadala@gmail.com",  
  "city": "Pileru"  
}
```

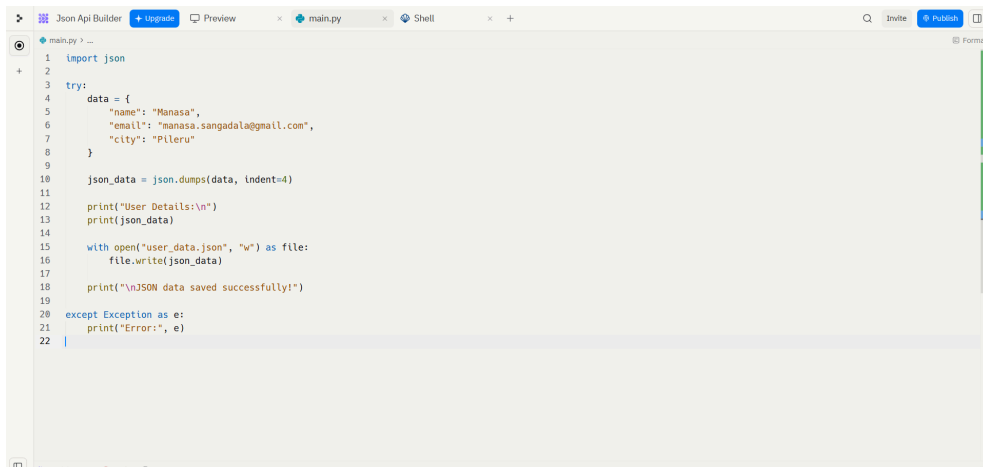

JSON data saved successfully!

Features Implemented:

- JSON handling
- Data conversion
- File handling
- Exception handling
- JSON file storage

Conclusion:

Successfully implemented JSON handling and file storage operations using Python.

A screenshot of a code editor window titled 'Json Api Builder'. The editor shows a Python script in a file named 'main.py'. The code defines a dictionary 'data' with user details, converts it to a JSON string using 'json.dumps', prints it, and then writes it to a file named 'user_data.json' using 'with open' and 'file.write'. It also includes an exception handling block. The code is as follows:

```
1 import json  
2  
3 try:  
4     data = {  
5         "name": "Manasa",  
6         "email": "manasa.sangadala@gmail.com",  
7         "city": "Pileru"  
8     }  
9  
10    json_data = json.dumps(data, indent=4)  
11  
12    print("User Details:\n")  
13    print(json_data)  
14  
15    with open("user_data.json", "w") as file:  
16        file.write(json_data)  
17  
18    print("\nJSON data saved successfully!")  
19  
20 except Exception as e:  
21    print("Error:", e)  
22
```
